

STEMwerk separates vocals, drums, bass, other, and optional guitar/piano stems inside REAPER. Processing is local. The first run may need setup, backend packages, and model downloads.

Global Workflow

1. Install or update

Use the Windows installer, or ReaPack on macOS/Linux. Run STEMwerk-SETUP.lua when setup, repair, or dependency checks are needed.

2. Choose the source

Select media items, selected tracks, or a time selection. The active REAPER selection determines what STEMwerk will process.

3. Choose model, stems and device

Pick Fast, Quality, or 6-Stem; choose vocals/drums/bass/other; use Auto unless you need a specific CPU/GPU backend.

4. Choose output

Create new stem tracks, group them in folders, or write stems in-place as takes on the source item.

5. Start and review

Click STEMwerk, follow the progress window, then check the created tracks, items or takes in REAPER.

Use the source type that matches the edit you already made in REAPER:

Time selection

Use a loop/time selection when you want only a region. If no items or tracks are selected, STEMwerk can process that range.

Media items

Select one or more media items to process complete items. Items can be on one track or across multiple tracks.

Tracks

Select tracks when you want STEMwerk to process the material on those tracks and return stems as new tracks or folders.

Takes / in-place

Use in-place output to add stems as takes, then use Explode Takes to split selected multi-take items into tracks, in-place items, or ordered items.

Toolbar / Actions

Top-right icons

Language: switch the STEMwerk UI language.
 Tooltips: show or hide hover explanations.
 Day/night: switch between light and dark mode.
 FX: enable or disable visual effects/art animation.

STEMwerk for REAPER

Setup, Backends and Updates

Windows

Use the installer for normal setup. ReaPack only installs scripts and is not the recommended first-time Windows setup path.

macOS / Linux

Install with ReaPack, then run STEMwerk-SETUP.lua for first setup or repair. Existing working venvs usually do not need setup after every update.

CPU/GPU

Auto chooses the best detected backend. CPU is the safest fallback. CUDA, DirectML, ROCm and MPS depend on hardware, drivers and Python packages.

First run

Creating the venv, installing packages and downloading the selected model can take several minutes. Later runs are normally faster.

Troubleshooting

If STEMwerk reports missing Python, FFmpeg, backend packages or a broken venv, run STEMwerk-SETUP.lua again and check the shown logs.

Keyboard Shortcuts

Main window

Enter/Space	Start separation
ESC	Close or cancel
F1	Open Help & Art Gallery
1-6	Toggle stems: Vocals, Drums, Bass, Other, Guitar, Piano
K/I/A	Karaoke/Instrumental, All stems
V/D/B/O/P/G	Preset: Vocals, Drums, Bass, Other, Piano, Guitar
F/Q/S	Model: Fast, Quality, 6-Stem
+/-	Resize the main window

Help / Gallery

Enter	Start from Help or close completion
Space	Generate new art
Left/Right	Switch tabs
Wheel/drag	Zoom, pan, rotate, or move content
Double-click	Reset view

Install location

Windows: %APPDATA%\REAPER\Scripts\STEMwerk-reaper\

Linux: ~/.config/REAPER/Scripts/STEMwerk-reaper/

macOS: ~/Library/Application Support/REAPER/Scripts/STEMwerk-reaper/
